V6WK

Wheel Kit

Bolt on for V6 ONLY

The V6WK wheel kit is designed to bolt directly to the V6 bottom frame on either the left or right. 4" diameter medical grade casters with 1" tread width make it easy to move the unit over most surfaces. With the V6 front and back outriggers locked in the upright position, this wheel kit allows you to simply tilt the V6 onto the wheels and move it just about anywhere. Assembly is required.

The wheels remain off the ground until the unit is tilted to an angle just before the balancing point. When all the weight of the V6 is on the wheels, the unit will balance similar to a moving dolly. Care must be given when moving the V6 on angled and/or uneven surfaces.
(V6 sold separately)

Shipping Specifications:

Total kit weight of 5 lbs.
